an excellent introduction to feedback control system design this book offers a theoretical approach that captures the essential issues and can be applied to a wide range of practical problems its explorations of recent developments in the field emphasize the relationship of new procedures to classical control theory with a focus on single input and output systems that keeps concepts accessible to students with limited backgrounds the text is geared toward a single semester senior course or a graduate level class for students of electrical engineering the opening chapters constitute a basic treatment of feedback design topics include a detailed formulation of the control design program the fundamental issue of performance stability robustness tradeoff and the graphical design technique of loopshaping subsequent chapters extend the discussion of the loopshaping technique and connect it with notions of optimality concluding chapters examine controller design via optimization offering

a mathematical approach that is useful for multivariable systems

this useful reference provides recent results as well as entirely new material on control problems for partial differential equations

control and dynamic systems advances in theory and applications volume 56 digital and numeric techniques and their applications in control systems part 2 of 2 covers the significant developments in digital and numerical techniques for the analysis and design of modern complex control systems this volume is composed of 12 chapters and starts with a description of the design techniques of linear constrained discrete time control systems the subsequent chapters describe the techniques dealing with robust real time system identification the adaptive control algorithms and the utilization of methods from generalized interpolation and operator theory to deal with a wide range of problems in robust control these topics are followed by reviews of the decentralized control design for interconnected uncertain systems the computation of frequency response of descriptor systems by rational interpolation the techniques for the synthesis of multivariable feedback control laws and the effect of the initial condition in state estimation for discrete time linear systems other chapters illustrate practical efficient and reliable numerical algorithms for robust multivariable control design of linear time invariant systems as well as a complete analysis of closed loop transfer recovery in discrete time systems using observer based controllers the last chapters provide the techniques in robust policy making in the global economic environment and the implications of robust control techniques for continuous time systems this book will prove useful to process control systems and design engineers

multidisciplinary engineering systems design and optimization techniques and their application deals with techniques used in the design and optimization of future engineering systems comprised of 11 chapters this book covers techniques for improving product design quality in multidisciplinary systems these techniques include decomposition techniques for synthesis process optimization for aircraft systems actuator and sensor placement and robust techniques in system design and control process students research workers and practising engineers will find this book invaluable

the workshop on operator theory and boundary eigenvalue problems was held at the technical university vienna austria july 27 to 30 1993 it was the seventh workshop in the series of iwota international workshops on operator theory and applications the main topics at the workshop were interpolation problems and analytic matrix functions operator theory in spaces with indefinite scalar products boundary value problems for differential and functional differential equations and systems theory and control the workshop covered different aspects starting with abstract operator theory up to concrete applications the papers in these proceedings provide an accurate cross section of the lectures presented at the workshop this book will be of interest to a wide group of pure and applied mathematicians

the idea of optimization runs through most parts of control theory the simplest optimal controls are preplanned programmed ones the problem of constructing optimal preplanned controls has been extensively worked out in literature see e g the pontrjagin maximum principle giving necessary conditions of preplanned control optimality however the concept of optimality itself has a restrictive character it is limited by what one means under optimality in each separate case the internal contradictoriness of the preplanned control optimality the better is the enemy of the good yields that the practical significance of optimal

preplanned controls proves to be not great such controls are usually sensitive to unregistered disturbances including the round off errors which are inevitable when computer devices are used for forming controls as there is the effect of disturbance accumulation in the control process which makes controls to be of little use on large time intervals this gap is mainly provoked by oversimplified settings of optimization problems the outstanding result of control theory established in the end of the first half of our century is that controls in feedback form ensure the weak sensitivity of closed loop systems with respect to small unregistered internal and external disturbances acting in them here we do not need to discuss performance indexes since the considered phenomenon is of general nature but by far not all optimal preplanned controls can be represented in a feedback form
